**Antifever medicinal plants on native ethnics on Sumatra Island****M. BAKTI SAMSU ADI<sup>1,•</sup>, DIAN SUSANTI<sup>2</sup>, NUR RAHMAWATI WIJAYA<sup>3</sup>**<sup>1,2, 3</sup>Medicinal Plants and Traditional Medicine Research and Development Center.  
Jl. Raya Lawu No. 11 Tawangmangu 57 792, Karanganyar, Central Java, Indonesia.**ABSTRACT**

**Background:** Fever is a health disorder characterized by an increase in body temperature above normal, which almost everyone experiences. Therefore, the selection of fever is expected to provide an overview of how the knowledge of Sumatra ethnic communities in fever treatment is generally processed.

**Methods:** Research metadata of medicinal plants and *jamu* conducted by the Ministry of Health in 2012, 2015 and 2017 became the main sources. The study was conducted by interview and field observation methods to obtain medicinal plants. The informants of this study are traditional healers in every ethnic community in all provinces in Sumatra. Dummy tables containing provinces, ethnic, family, medicinal plants, potion numbers and traditional healers' codes were analyzed by Bray-Curtis similarity analysis based on the use of medicinal plants to obtain a level of similarity between ethnics and followed by scatterplots display using non-metric multidimensional scaling analysis.

**Results:** Medicinal plants usage by traditional healers in Sumatra has a low similarity among ethnic groups because the similarity index value to approximate zero. It shows that the group is quite specific in relation to the surrounding natural resources.

**Conclusion:** The low similarity index between ethnic groups in Sumatra shows that traditional medicinal knowledge among them is not interrelated. Their knowledge of developing hereditary based on experience and availability of natural resources around them.

## Introduction

As an archipelago, Indonesia has a considerable amount of ethnic and flora. The number of ethnic based on major groups as much as 633 group (1), while the flora reaches 20,000 species (2). The assets of ethnic and plants constitute a local intellectual knowledge with each traditional community that includes a wealth of knowledge about medicine using their surrounding natural materials. Local wisdom depends on location and time (3).

Regional isolation and culture have created different characteristics in the use of resources in different ethnicities, resulting in different local wisdom.

The role of local knowledge of ethnic communities in efforts to conserve natural resources and biodiversity is recognized in the 1994 Convention on Biological Diversity. A deeper understanding of the relationship between social and ecological dynamics results from studies of patterns of local use of natural resources, social and institutional backgrounds that guide the relationship between humans and nature (4). Management of natural resources based on local wisdom must be maintained because of the philosophy that makes it a heritage habitat for their survival (5)

Sumatra as a large island along with small islands around it, stretching from Aceh to Lampung Province, is one of seven regions in Indonesia historically the origin of an ethnic community (6). There are 70 indigenous ethnic groups inhabiting the area (7).

While Sumatra's rainforest has been declining year after year, it is possible to meet several other islands in Indonesia and a relatively large number of plasma. Sumatran, which measures the size of Sumatran forest in 2015, also has reached 11,56 million acres (8). The natural assets of Sumatra's forests are widely used by communities living nearby because of their efforts to stay healthy. Remote areas far from medical facilities, making the community strives to maintain their health by utilizing the natural resources that exist around them, thus becoming a local wisdom that is hereditary and performed by traditional healers in each ethnic group.

Research of medicinal plants and *jamu* that are implemented by the Ministry of health in 2012 until 2017 has been producing ethnomedicine potion metadata and plants are used from the entire territory of Indonesia. Increased economic development and expand the mobilization of people. Acculturation is not inevitable. Considering the conditions, based on potions medicinal plants used, researchers want to see whether there are similarities in the treatment methods of

traditional healers from ethnic groups on the island of Sumatra.

## Materials And Methods

### Study area

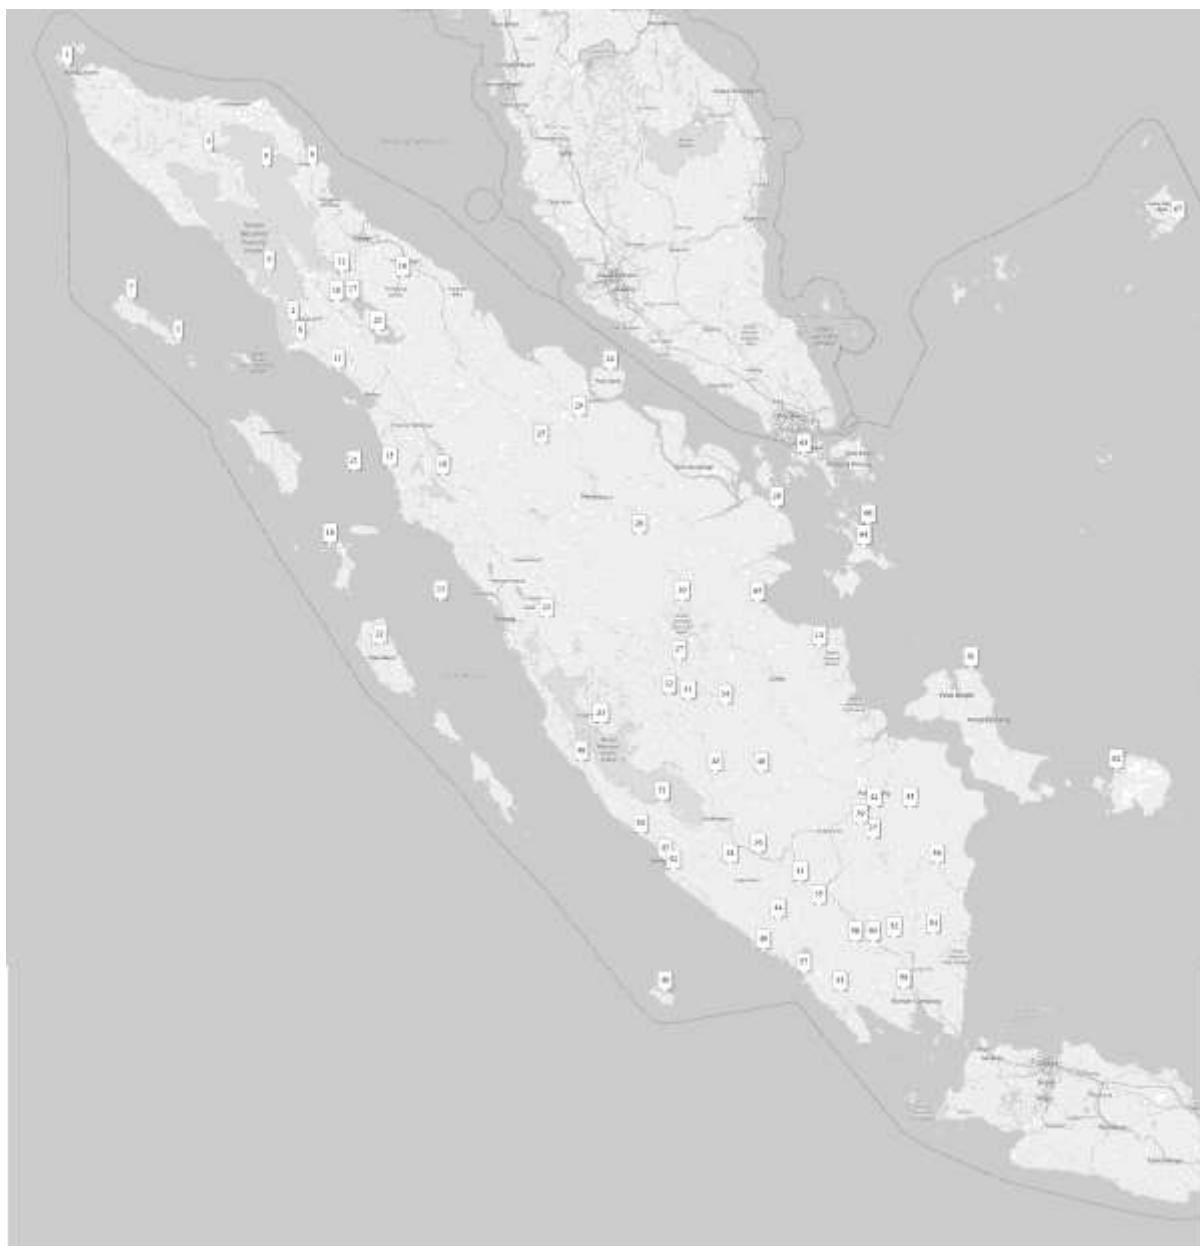

The research data is taken from the metadata of Medicinal Plants and *Jamu* Research (RISTOJA) conducted in 2012, 2015 and 2017. The research was conducted by interviewing informants (traditional healers) in each of the ethnic groups and field observations to find species of medicinal plants used in the process treatment. Interviews were conducted by anthropologists, whereas observations of medicinal plants were carried out by botanists. Informants were selected based on public information, followed by a snowball sampling method to obtain further informant. The location focus is all ethnicities in the Province on Sumatra Island, from Aceh to Lampung (figure 1). The data needed includes all potions for fever without considering the trigger factors. Data includes provinces, ethnic names, and scientific names of plants.

### Data analysis

The similarity analysis to the presence and absence of medicinal plant use between ethnic groups was carried out using Bray-Curtis similarity analysis (9). The Bray-Curtis similarity analysis is a nonparametric multivariate comparison within and between groups. This resulted in a global test of statistics called R, which ranges from -1 to 1 with a value close to zero that showed no similarities at all.  $R < 0.25$  : indicates there is little resemblance,  $0.25 \setminus R \setminus 0.75$  : some similarities though overlapping,  $R > 0.75$  groups have many similarities, and  $R = 1$  is identical. Further data were analyzed with the ordination of a Non-Metric Multidimensional Scaling (NMDS) (10). Based on the NMDS obtained ordination visualization in two dimensional graphics regarding the degree of similarity between the ethnic maps in Sumatra based on the use of medicinal plants. Data were analyzed with software Paleontological Statistics (PAST) version 3:20 (11).

## Results

The study was conducted by interview method and field observation of 455 traditional healers from 10 provinces in Sumatra. Data was filtered with only the potions for fever selected. There were 242 traditional healers from 67 ethnicities who have potions for fever, with a total number of 347 potions. The medicinal plant species used were 320 species from 100 families, as shown in Table 1.

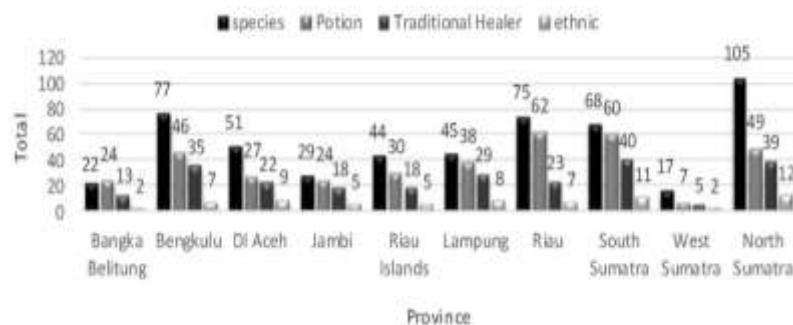

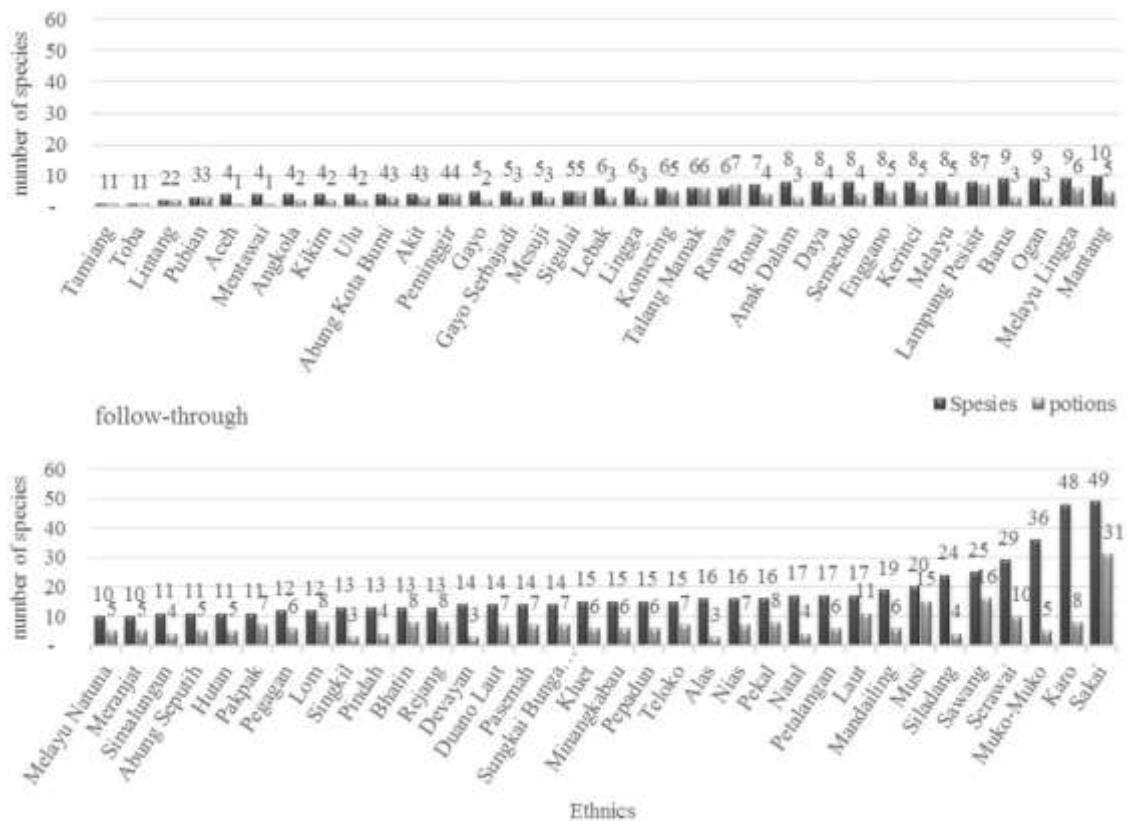

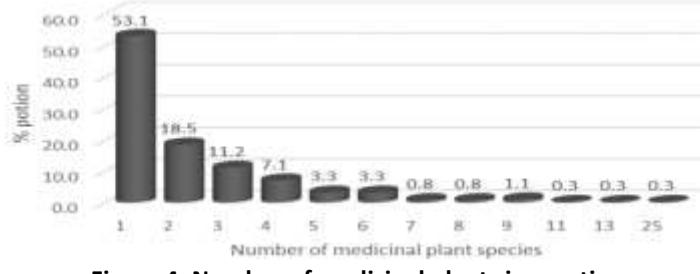

Figure 2. Number of ethnicities, traditional healers and medicinal plant species by province

**Figure 3. Number of fever potions and medicinal plants used by each ethnic group**

The number of medicinal plant species by province is shown in figure 2. North Sumatra is a province with the highest number of medicinal plants, where 105 medicinal plants species used in 49 fever potions from 26 traditional healers in 12 ethnics. This shows that North Sumatra has a higher knowledge of local wisdom compared to other provinces, supported by the number of ethnic groups in it. Meanwhile, the less number of species for fever potions is in West Sumatra, which is 17 species used in 7 fever potions by 5 traditional healers from 2 ethnics.

The number of potions and medicinal plant species based on ethnicities (Figure 3), shows that the medicinal plant species usage distribution varies among ethnic. The Sakai ethnics is the medicinal plant's most user (49 species) with a total of 31 potions of fever, while Tamiang and Toba ethnic has the least number of medicinal plant species used and potion of fever, one species and potion each. It's shows that Sakai ethnic has high dynamics and broad knowledge in managing local wisdom and its natural resources compared to other ethnics in Sumatra.

**Figure 4. Number of medicinal plants in a potion**

Potion of fever usually uses various species of medicinal plants as a constituent and numbers of medicinal plants used in a potion showed in Figure 4. Most of the fever potions contain one species of medicinal plant as a

single potion (53.1%). Compound fever potions of ethnics in Sumatra are using between 2 to 25 medicinal plant species. The compound fever potion with the most

composition is owned by Karo (North Sumatra) by using 25 species of medicinal plants as compiler. The medicinal plants used in the Sumatran ethnics fever potions come from various families. The number of

medicinal plant based sort by their family shows that *Fabaceae* has the most common used species (22 species), followed by *Poaceae* (20 species), and *Zingiberaceae* (17 species) (Figure 5).

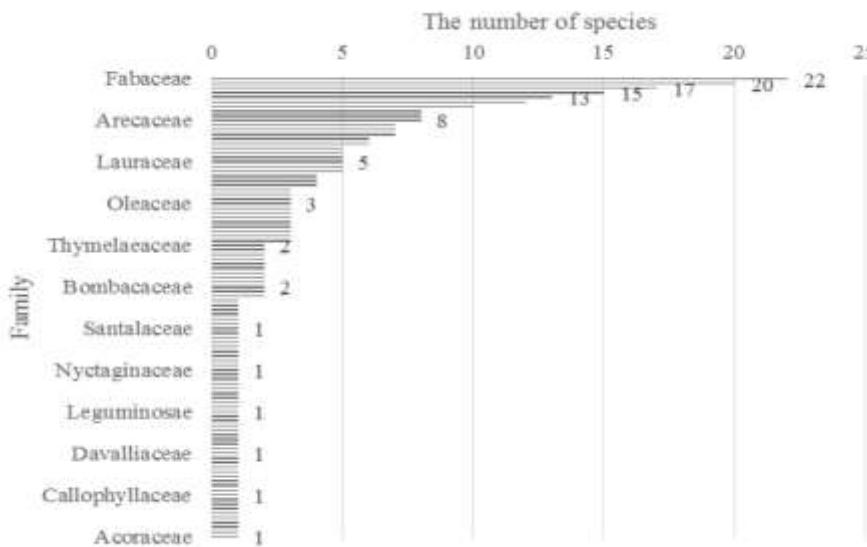

Figure 5. Number of medicinal plant species per family

Based on Province, ethnicities, and traditional healers, the use of medicinal plants is shown in Figure 6.a. *Hibiscus rosa-sinensis* has largest user that covering 9 provinces, 20 ethnics and 26 traditional healers. While based on the frequency of use (figure 6.b) there are 189 species (59.1%) which are only known and used as a fever potion by a traditional healer. The use of one species by one traditional healer makes the medicinal plants for fever more diverse.

Multivariate analysis with unweighted pair group methods with arithmetic averages (UPGMA) algorithms and the Bray-curtis similarity index to see the degree of inter-ethnic similarity in Sumatra based on medicinal

plants used is presented in Figure 7. The cophenetic test of the correlation by using dendrogram is 60.55%, so it can be trusted and groups that are formed in proximity can be accepted.

Figure 7 shows the degree of similarity in the use of medicinal plants in the treatment of fever is varied. Gayo Serbjadi and Bonai are ethnic with the highest similarity (0.5), which means there are several similarities. While when viewed as a whole, the level of similarity between ethnic groups in Sumatra ranges from a few similarities to a slight resemblance. This is because the similarity index value is in the range of 0.5 to zero.

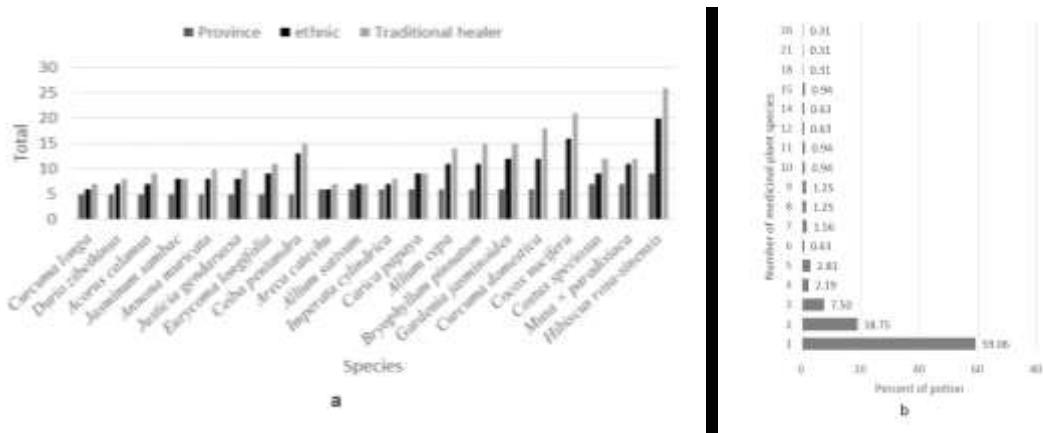

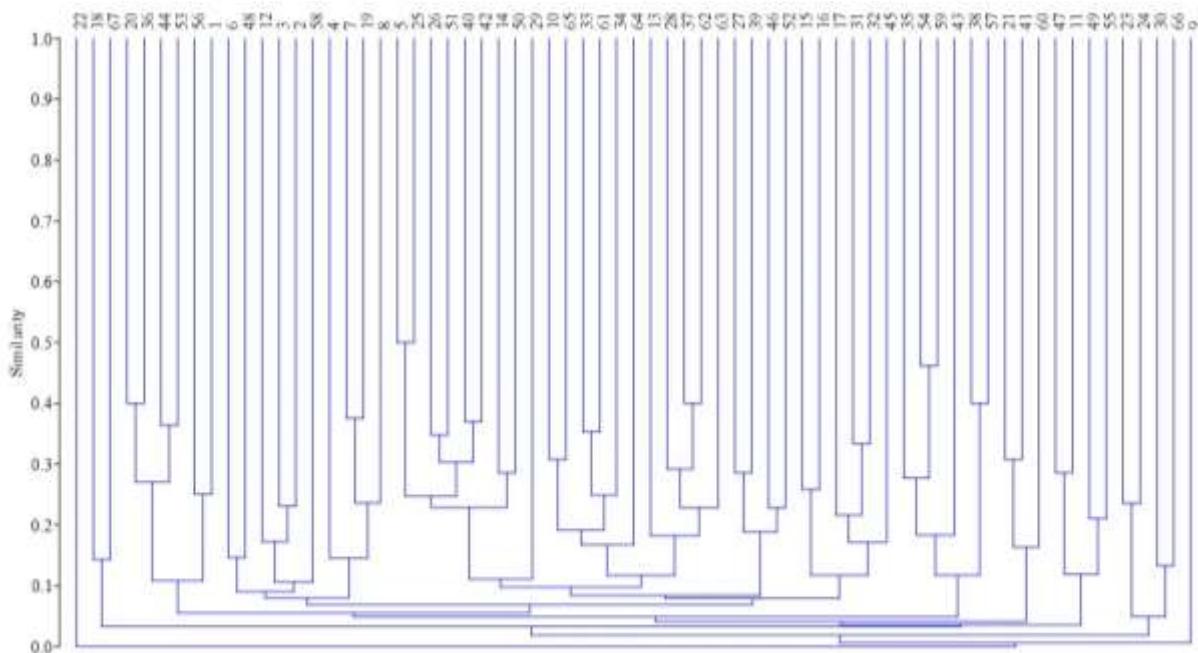

Figure 6. a. Medicinal plant species used by ≥ 5 traditional healers. b. The number of medicinal plants in a potion

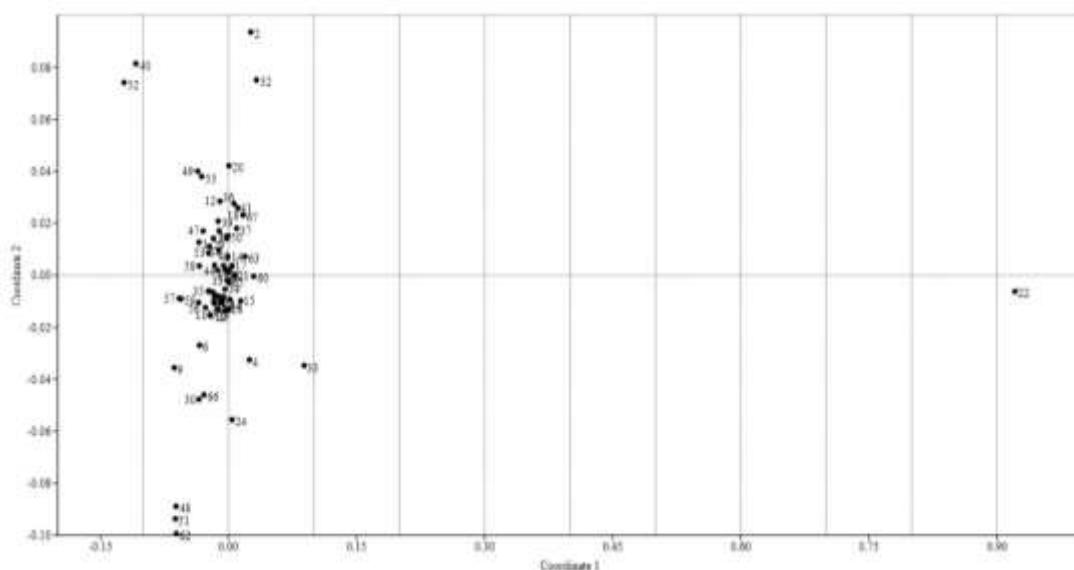

**Figure 7. Dendrogram of inter-ethnic similarity levels in Sumatra with the Bray-curtis similarity index based on the use of medicinal plants.**

Note: 1: Aceh; 2: Alas; 3: Devayan; 4: Gayo; 5: Gayo Serbajadi; 6: Kluet; 7: Sigulai; 8: Singkil; 9: Tamiang; 10: Angkola; 11: Barus; 12: Karo; 13: Mandailing; 14: Melayu; 15: Natal; 16: Nias; 17: Pakpak; 18: Siladang; 19: Simalungun; 20: Toba; 21: Ulu; 22: Mentawai; 23: Minangkabau; 24: Akit; 25: Bonai; 26: Duano Laut; 27: Hutan; 28: Petalangan; 29: Sakai; 30: Talang Mamak; 31: Anak Dalam; 32: Bhatin; 33: Kerinci; 34: Pindah; 35: Daya; 36: Kikim; 37: Komering; 38: Lintang; 39: Meranjat; 40: Musi; 41: Ogan; 42: Pegagan; 43: Rawas; 44: Semendo; 45: Teloko; 46: Enggano; 47: Lebak; 48: Muko-Muko; 49: Pasemah; 50: Pekal; 51: Rejang; 52: Serawai; 53: Abung Kota Bumi; 54: Abung Seputih; 55: Lampung Pesisir; 56: Mesuji; 57: Peminggir; 58: Pepadun; 59: Pubian; 60: Sungkai Bunga Mayang; 61: Lom; 62: Sawang; 63: Laut; 64: Lingga; 65: Mantang; 66: Melayu Lingga; 67: Melayu Natuna

Based on the dendrogram, Mentawai ethnicity is quite interesting because of the zero similarity index value. This means that it is not similar to any ethnics. This is clearly seen in the NMDS scatter-plot ordinances (Figure 8). These conditions indicate that Mentawai ethnic uses

medicinal plants for fever that are completely different compared to other ethnics. They use four species of medicinal plants that are not found in other ethnics, namely: *Dracaena maingayi*, *Globba fecunda*, *Hedyotis philippensis* and *Scaphochlamys* sp. (see Table 1).

**Figure 8. Scatterplot NMDS ordination in Bray-curtis similarity index between ethnic groups.**

## Discussion

*Hibiscus rosa-sinensis* is a plant that is most widely used by traditional healers. This indicates that these plants are easily found in Sumatra. The distribution of this plant is quite extensive and can be found in all parts of Indonesia. In addition, it is indicated that some traditional healers in Sumatra have the same comprehension that empirically *H. rosa-sinensis* is useful to treat fever.

Mentawai ethnic live in the Mentawai Islands which consists of four large islands namely Siberut, Sipora, North Pagai, South Pagai, and several small islands. Siberut is the largest island with an area of 400,03 ha (12). *Dracaena maingayi* (*Asparagaceae*) and *Hedyotis philippinensis* (*Rubiaceae*) are shrub plants that are found growing on the island of Siberut. *D. Maingayi* is a Peninsular Malaysian endemic plant that grows in mangrove forest and coastal forest types, while *H. philippinensis*, which is an indigenous Malaysian plant, grows in valley forest habitat types (13). *Globba fecunda* (*Zingiberaceae*) is one type of *Globba* found in Sumatra. *Globba* sp. often found in forest areas in the Sumatra valley (14–16). *Scaphochlamys* sp. is an endemic plant of Sumatra and Malaysia (14,17).

Mentawai ethnic has different medical knowledge from other ethnics in Sumatra (figure 8). Siberut Island, which is occupied by Mentawai ethnic, has a diversity of plants that is quite different from other islands. The Siberut island ecosystem consists of *Dipterocarpaceae* forest, mixed lowland forest, freshwater swamp forest, coastal forest, mangrove forest, and secondary forest (18). In the treatment method for ethnic Mentawai, an elder act as a traditional healer as *Sekerei*. *Sekerei* is only given the authority to cure diseases and help lead traditional ceremonies if rimata (ethnic leaders) are absent. *Sekerei* holds *Arat Sabulungan*'s belief in doing the treatment. *Arat Sabulungan* is a belief about the existence of a relationship between humans and the supernatural. The relationship is bridged by a *Sekerei*. For the Mentawai ethnic, the surrounding environment, especially the diversity of plants, is an important part of the existence of the *Sekerei*. *Sekerei* implements traditional medicine with its ability to process medicinal raw materials taken from various plants found in the Mentawai forest (19,20).

Treatment of fever by traditional healers from all over Sumatra based on the use of medicinal plants shows a low level of similarity. This shows that traditional healer

has specific local wisdom in their respective regions by fully utilizing the natural resources around them.

## Conclusion

The use of medicinal plants to treat fever in each ethnic group is still based on hereditary experience. Low similarity of plants that is used between ethnic groups, caused by barriers such as geographical and cultural. The distribution and availability of plants that can be used as medicine in each place are also important influencing factors.

The differences in medicinal plants usage among the ethnic groups enriches the diversity of knowledge and local wisdom in treating fever. In prospect that the diversity of empirical knowledge from ethnic groups throughout Sumatra could be developed in order to advancing the world of health.

## Acknowledgments

Medicinal plant and *jamur* research has been carried out using the DIPA of Medicinal Plants and Traditional Medicine Research and Development Center, National Institute of Health Research and Development, Ministry of Health Republic of Indonesia by involving various stakeholders from the central government to the regions and various universities from all over Indonesia.
