ABSTRACT

Pandemic condition is an urgent awakening involving many countries because it has through to the fore the fragility of their healthcare. Lack of preparedness has unfortunately placed vulnerable a part of the population at greater risk, not just of constructing injection but also of spread of disease infection. Recently the whole world is affected by the pandemic condition -COVID 19. Due to this condition, many of us faced tons of problems like people cannot go their necessities, can not do their job so there's a fall in their economic level to neglect this sort of problem several methods should be taken. It's a challenge now to manage a worldwide office of individuals in their own homes. The technology we've now really does play up the opportunities, but it also highlights the prices and potential risks of individuals being atomized from their place of labor. The World Health Organization (WHO) assessed the outbreak as an epidemic to involve further coordinated attempts to decrease the medical and economic consequences of this pandemic as soon as possible. Defeating this pandemic is impossible without united and coordinated international attempts shaped by all countries of the planet. This article aims to convey the problem faced by common people during pandemic conditions.

INTRODUCTION

Pandemic is defined as "an epidemic occurring over a really wide area, crossing international boundaries, and typically affecting an outsized number of people [1]. Pandemics are large-scale that outbreaks the infectious diseases which could substantially increase morbidity and mortality over a good geographic place and cause massive monetary, social, and political disruption. Evidence shows that the likelihood of a pandemic has multiplied during the last century thanks to accelerated international journey and integration,

urbanization, changes in land use, and greater exploitation of the herbal environment [2]. Despite those enhancements, massive gaps and challenges exist in worldwide pandemic preparedness. Progress toward meeting the IHR has been choppy, and lots of countries were unable to satisfy simple necessities for compliance[3]. People affected thanks to pandemic conditions may suffer from tons of mental depression and fear that include the high death rate, resource and food insecurity, inequality, and knowledge with infected and sick individuals, which may cause some adverse

psychological state outcomes during these epidemics[4] [5].

Some of the Previous articles were referred, in of that one emphasis about the pandemic condition-Ebola virus-Multiple outbreaks, notably the 2014 West Africa Ebola epidemic, have exposed gaps associated with the timely detection of disease, availability of basic care, tracing of contacts, quarantine, and isolation procedures, and preparedness outside the health sector, including global coordination and response mobilization[6][7]. Another pandemic condition is Spanish influenza in 1916, this resulted in more teenage people being affected than the labour force due to various reasons like in their academics, but most of the people died due exposure to influenza viruses[8][9]. The COVID-19 pandemic is likely to put healthcare professionals across the world in an unprecedented situation, to get the success they are working under a lot of pressure. These decisions may include how to allocate scant resources to equally needy patients, how to adjust their own physical and mental social insurance needs with those of patients, their longing and obligation to patients with those to loved ones, and how to give care to all seriously unwell patients with compelled or deficient assets. This may cause some to experience moral injury or mental health problems[10] [11][12]. Previously our team had conducted numerous clinical trials and lab studies and in-vitro studies [12-27] over the past 5 years. This article tries to emphasize the impact of the pandemic condition among people, some of the previous articles try to convey the same thing but not yet clear, some article discusses only the level of loss in the pandemic condition that is the impact of a pandemic on an economic level.

A review of scientific literature was done in preparation of the manuscript. The system and data-based searched for relevant articles from the PubMed and google scholar, About 50 articles were collected and analyzed, and reviewed. Databases of the journal were searching for articles based on the keyword pandemic condition impact of the pandemic condition, population economic impact due to pandemic condition cross-references were also included.

Awareness about the pandemic condition

First, awareness about the pandemic condition should be passed via communication so that it can convey to everybody. It can be passed via social media because social media is one of the major networks which can pass the news worldwide in quarantine time[28] some of the preventive measures like wearing protective masks, vaccination, more creative precautions, and outbreaks are correlated to demand -measles, mumps, and rubella vaccines[29]. For some

pandemic conditions vaccines have been found, but COVID 19 that there is no vaccine has been found yet so the major cause is the spread of disease. To prevent from the disease since there is no vaccine certain preventive measure such as social distancing, isolating are the some of the methods which can prevent from disease[30] various analysis has been done and finally they conclude that spread of awareness, prompted the reduction of disease among the people, some article says that disease can spread via direct contact like shaking hands, etc this for some disease whereas some diseases can spread via indirect contact. [31]. One of the ways to reduce the spread of disease planning and coordination of the situation by monitoring and assessment[32]. Another way is by the social distance between people, Measures by individual/household level measures[33]. The effects of social distancing are predominantly studied in the viewpoint of centrally controlled action[34]. Early phase public health efforts contain limit outbreaks([35] During this condition nutritional awareness is the most important thing [36][37]

Problem faced-poverty

People affected by infectious diseases or disease causes due to deficiency in nutritional food [38]. This happens because of “no work” they won’t get their wage/income so surely they won’t get adequate food requirements so this is also one of the ways to get affected by the diseases [39]. Because of this person’s behavioral changes causes fear, induced aversion in workplaces, other public gathering places, a primary cause of negative shocks to economic growth during a pandemic. [40]. During pandemic mitigation measures can cause significant social-economic disruption[41]. But the deaths associate with future pandemic shows greater in developing countries as well as in industrialized countries[42] It can likewise be incorporate need access, sufficient clinical consideration powerless general wellbeing frameworks, social factor lodging conditions, population density,- host factors, for example, nutritional status, co-existing medical conditions[43][44].

Economic level -Poverty line People

As far as for all developing countries economic status is very much important to them. When it comes to poverty it is vice versa. Fastest growing economic level, poverty decreases the status in economics [45][46]. During pandemic conditions quarantine is important, so most people will suffer low income due to their economic status in society. As for as considered COVID -19 quarantine condition affect the people, Due to Unemployment Rate there is expanded almost 19% inside in month,

reaching 26% joblessness across India, concurring Center for Monitoring Indian Economy Nearly 140,000,000 (14 crores) Indian lost work during the lockdown and over 45% families across the nation over have detailed a salary drop when contrasted with the earlier year. Day to day life, money is the most important requirement for every one. The same money has many negative aspects too. Money is found to play a very vital role in transmitting diseases.

Pandemic condition

Most diseases that cause the pandemic condition spread are only by animals, birds not from any other sources. The word pandemics originated through the -zoonotic transmission - pathogenic animal, humans [47]. So some people are potentially exposed to the world to control the spread of diseases[48]. So several tests have been done to them to detect the test, people who are suspected to have been isolated and treated, of all affected countries done this initially the spread can be controlled in community transmission[49][50] The word pandemic is due to an outbreak of infectious diseases that results from in significant economic, social, -political disruption[51][52]

Challenges to overcome

To overcome the challenge in pandemic conditions, several methods have to been taken every country that is affected by ted countries should provide better medical care. But due to fear of the spread of diseases, there was a lack of medical and public health centers. By characterizing pandemic risk identifying gaps has been pandemic preparedness is essential to prioritizing, targeting the capacity[53][54]that provide relevant public health information and countries which has vulnerable populations, the decision taken by the government should be informed [55]such kind of appropriate action will protect the people and minimum the social disruption[56][57][58]

Measure of government

There were several measures taken by the government during the pandemic condition, they provide the basic needs like food to the poor people because due to the lockdown condition they won't get income[59][60]water is one of essential need during pandemic even water cannot be affordable to people [61]. The duty that they have in advancing preferable way of life is more noteworthy over before as the way of life is continually changing a ton and it represents a genuine danger to society these days as we face a ton of trouble in overseeing wellbeing issues and mental unsettling influences because of the unfortunate ill-advised dietary patterns. Building the pandemic situational Awareness was complex, which required

coordination of the public-private sector across the country.COVID 19 pandemic condition causes the opportunities takeover acquiescence by India.Government announcing the lift of prioritized over livelihood when later changed on equal importance being life livelihood. [62]

The limitation of this article is that it cannot discuss all the problems faced by the people during pandemic conditions. The future scope of this topic, some preventative measures should be taken initially so that there will be no loss in the economic level as people are affected.

CONCLUSION

Unlike the most natural disaster,pandemic is a geographically and damaging event. There are strong ethics in global health in building capacity to detect the response to pandemic threats. The public organization should give awareness about the pandemic condition as well the government should take some initial preventive measures.Our job is to clearly define these problems and evaluate potential solutions. For each problem, we identify needs, resources, priorities, and obstacles. The process is often complex; even if we identify a theoretically optimal solution, successful implementation requires stakeholder support and overcoming financial, legal, or institutional obstacles. This is, fortunately, a time when many stakeholders are willing to cooperate; our challenge is to use this opportunity to help achieve both short and long term goals. Most people see the pandemic as a unique problem that requires special solutions. To planners, it presents a complex set of economic, health, equity, and environmental problems that should be addressed in ways that are consistent with other community goals. More comprehensive analysis helps identify truly optimal solutions.

AUTHOR CONTRIBUTION

The idea was conceptualized by Lakshminarayanan Arivarasu, collection of the literature, and drafting the manuscript was by Kavya Shree, revising the manuscript for publication was done by Leslie rani.
