

An integrated approach to solving the problem of treating cancer

Shelshakova Natalia Nikolaevna¹

¹candidate of psychological sciences, docent, Petrozavodsk State University, Petrozavodsk, Russia

Abstract

The problem of oncology is a heavy burden for all mankind. But, unfortunately, doctors were mainly involved in solving this problem. If you look at this problem in a complex way, then you need to start with a philosophical approach, namely, if the cause has not been eliminated for many centuries, does the scientific community need to focus on identifying methods for removing malignant tumors. Perhaps you need to pay attention to 1) a comprehensive solution to the problem (modern computer technologies, engineering developments, etc.); 2) psychological support of the family, etc.

Cancer, problem, treating

INTRODUCTION

The article will outline the algorithm of work on the problem of treating cancer.

The legal approach to rehabilitation is as follows: a citizen must be protected from any negative information that destroys his psychological health. Skeptics may disagree when speaking about the need to adhere to the medical code, which postulates the provision of reliable information to the patient. I hasten to disagree, because if for a century great scientists in the field of medicine and other sciences have not found a way to eliminate malignant neoplasms, then society does not have accurate information in this area, respectively, we have no right to inform the patient about the presence of a disease that at the moment does not have an effective toolkit to eliminate. This means that it is necessary to move from a causal approach to a symptomatic one, that is, from eliminating the tumor to treating the symptoms to which it leads.

From the point of view of the technological approach, the human organism should be considered as an energy machine that can be controlled. By influencing only medications and radiation therapy directly on the human organism, we weaken its resources. The nervous and circulatory systems in severe pathologies are restored with difficulty or are not compensated for, therefore, it is necessary to initially eliminate pain

by acting on the nervous system. Eliminating pain syndrome, we lower the threshold of sensitivity, which means that biological needs will be satisfied regularly.

If we treat the human organism as an energy machine, then it is necessary to install an electronic resource (implant, plate) that will transmit data about the state of the human organism, as well as with various intensification or weakening, affect all systems of the organism: the sensor can increase or decrease blood flow, increase or decrease intestinal peristalsis (for emptying in patients with intestinal pathology), enhance the work of the urinary system, directing impulses to the spinal sacral region, etc. Such a sensor can be placed in the form of an implant in the jaw and ear. Therefore, specialists in the field of information and engineering disciplines are reliable partners in solving the problem of oncological diseases.

In addition to affecting local areas of the organism, the sensor, due to the transmission of nerve impulses to the vascular system, namely by expanding and constricting blood vessels, increasing serotonin, creates a new energy potential that the organism needs.

This implant can also help with severe pathologies, when the functioning of the organism's regulatory system is reduced. Voice reactions emanating from

the implant during a human's sleep will prevent cardiac arrest, resume breathing.

The work of the media can consist in the work of radio receivers (listening to songs, news) with pre-prepared texts with a sound range that affects the blood flow of the cerebral vessels and promotes breathing. News with negative content contributes to vasoconstriction and pressure reduction, news with positive content contributes to the opposite effect. But we must remember that each individual may have different ideas about positive and negative information, therefore, at the initial stage, it is necessary to find out the individual-typological characteristics of a person and include information in accordance with his attitudes, and as the treatment progresses, the content of the information should change.

The tasks of oncologists will change: from removing a tumor to accompanying a patient and his family. So at the patient's place of residence, special support systems should be installed: vibration, ventilation, etc. Not forgetting about the idea of a person as a biological subspecies, it is necessary to remember about the inadmissibility of an overdose of drugs, the drug should not eliminate the problem, but only start the mechanism of cell renewal of the system that has weakened. And then, in the presence of energy potential, the appearance of a minimal pain sensation in an organ (symptom), the patient should go to a specialist. For example, if there is a neoplasm in the uterus, the sensor enhances the unpleasant odor, the gynecologist will make the necessary diagnostic scrapings in the uterus, removing the neoplasm at the initial stage. Modern equipment makes it possible to expand the diagnostic stage by including surgical treatment (by default), thereby preserving the psychological health of the patients: came to the diagnosis (the doctor carried out both the diagnosis and treatment). The main task of the doctor is to preserve the life and health of the patient, which primarily includes preventing negative information from reaching the human's consciousness. So working on the symptoms, at the expense of the sensor, we make it clear to the person which specialist should be contacted, without sending to the oncologist and without informing about the presence of a thoroughly unexplored neoplasm. Accompanying people with severe pathologies includes a set of measures: the selection of a complex of voice vibrations (cry of a child, barking of a dog, clatter of a car, bus, rain), which contribute, without resorting to increasing the dose of drugs due to vibration of a certain density, clarity, consistency, influence on various organism systems.

These systems should be specially guarded, since the presence of such a sensor can facilitate scanning of frequencies in the region of various parts of the

brain, which means reading the thoughts of another person, therefore only highly moral people should be allowed to the problem of accompanying people with cancer. Therefore, in the training of a doctor, it is especially important to determine the moral status of a person, to correct the moral «dislocations».

Interdepartmental interaction of specialists in the treatment of neoplasms

1. Distribution of opportunities in cancer treatment: dentists - the installation of crowns and implants, cosmetologists - the introduction of injection procedures, the development of creams that expand the pores to compensate the respiratory system. We work on the principle "everything breathes in the human organism". Specialists in manicure design - massage, coating with material with ultraviolet radiation (warming up the muscles), pedicure specialist - impact on biologically active points that activate all organism systems. Designers make clothing and footwear with a thermal or cooling effect. Massage therapists - use specific massage techniques to increase blood flow.
2. In accordance with the previous method, in case of difficulty breathing, it is necessary to learn internal breathing with the expansion of the internal muscles of the abdomen until breathing is restored.
3. Interaction of dentists, engineers and system administrators: implantation of plates into the crowns of teeth in order to activate areas of the brain in severe brain pathologies.
4. With a "tired" brain - opening the canals of living teeth to the nerve endings, applying an electronic plate and direct action on the brain tissue in order to supply blood and restore new nerve cells.
5. It is necessary to renew the blood using a new technology, namely, the composition of the products includes substances that, when they enter different parts of the digestive tract under the influence of different voltage of the sensor, change their properties and, with a new change in voltage, easily renew blood vessels and are absorbed into the blood.
6. The improved composition of the products will allow during the recovery period to facilitate the work of "tired" organs "(for example, during bowel movements, increased work of some parts of the intestine is not required).
7. When studying a tumor, it is necessary to establish the exact location of the localization, and by means of the sensor determine from which part of this formation there is an impulse of a greater degree of voltage, from this side it is most likely that the wall will become thinner, which means that during radiation therapy, energy should be supplied only to a part of the

neoplasm, which produces a strong impulse without affecting other living areas.

8. When working with newborns, it is possible to place an implant in the skull region (fontanelle check), mini-implants into the cells of hair follicles, and install dental implants before the teeth appear. Working with drones that will be magnets for various body systems.

In general, from the point of view of a philosophical approach to a problem that has not been solved for a long time, it is necessary to look like this: in the life of a human as the highest stage of the universe there are no unsolvable problems, which means that a new formation should be treated as the appearance of an adopted daughter and, accordingly, read the Family Code. When an adopted child appears, it is necessary to clean up the house (to establish the work of all organs and systems of the body), then to acquaint with family members (compensation is the work of those parts of the body that function next to neoplasm), then to acquaint with the place of residence and if you don't like it, change the place (after the start of treatment, if all body systems are restored, there is no need to take further removal of the tumor). If the neoplasm grows and interferes with parts of the brain, then a method like rhombinonade is applicable, when, in cramped conditions, the participant uses only a minimum of objects and survives. To do this, first, by means of a sensor, medicines, nutrition, a healthy lifestyle, soften the walls of the neoplasm, and then dehydrate the body (under the supervision of doctors - a sensor - remote control) and give the opportunity to work (increased adrenaline levels), as a result, the neoplasm will dry out, disappear or move. At the time of treatment, the working conditions for cancer patients must change, while the direct employer with whom the employment contract is concluded changes the working conditions in accordance with the instructions of the doctors.

Returning to the question of the ambiguity of the causes of malignant neoplasms, it is necessary to determine the general conditions for maintaining psychological health in general.

The cancer prevention system should include:

1. Compliance with the constitution and laws that are based on moral norms and rules.
2. Determination of a common code of ethics and rules for all countries of the world.
3. Understanding that the union of a man and a woman determines the harmony of the world. In the presence of dysfunctions of systems, it is necessary to come to a solution to the problem (the internal and physical state must coincide).
4. Ensuring the complete safety of children (own or from other parents) is the basis for ensuring their own health and well-being of the country. Treating children as the greatest value will

contribute to the rapid spread of positive energy, which means the safety of the world as a whole. Life according to the principle "there are no other people's children". This provision includes a ban on abortion. Compliance with the terms of puberty and the conclusion of a marriage union.

5. Treatment of all types of addictions, especially love and psychoactive. Unrequited love, the death of a loved one, alcohol abuse, nicotine, etc. must be compensated as soon as possible.
6. Taking care of the body (timely prevention and referral to doctors, regular physical activity, visits to cosmetologists, etc.)
7. Compliance with the glycemic index. Ideal weight should be related to blood sugar indicators.

CONCLUSION

Work with people should be based on the principle of health preservation, therefore, the prevention of any disease should begin with a reflection of one's own life on the subject of its correctness and incorrectness. This is not about the concept of belief or atheism. We are talking about the difference between human and animal, human is the highest degree of nature, that is, a biological subspecies is still a source or receiver of negative energy. As soon as moral postulates (laws) are observed, including "love your neighbor as yourself," the organism acquires a soul. Here the second part of the phrase is of particular importance, namely, do not become, due to low self-esteem, self-doubt, a victim of fraudsters, manipulators. Only when positive energy predominates in a person can we talk about the main meaning of life "God is in every person", thereby separating oneself from the biological species - an animal, and coming to an understanding of the meaning of one's own existence: renewing oneself and the world around oneself at the expense of positive energy.

So, the appearance of a tumor is a signal of a malfunction in the work of the whole organism, which means that a high probability of the end of a person's life path appears, respectively, the period of treatment should be perceived as a period of the beginning of a new life or a complete renewal of the body, rejuvenation.
